

The most successful global manufacturers will be those organizations that best manage increasingly complex and interconnected business operations. Realizing this, organizations are making new *Industry 4.0* investments – Internet of things (IoT), smart manufacturing, connected enterprise, digital twin, digital thread – to digitally transform their operations and achieve vital new levels of automation and adaptability.

The greatest challenge to Industry 4.0 success is data discovery and integration. Without the ability to unify and blend your myriad different data sources and data formats on demand, you cannot gain a complete picture into your business, and digital transformation will remain beyond your reach.

**Anzo integrates and blends your existing and future disparate data sources – internal and external, structured and unstructured – into a new gold mine of business insights that reveals new opportunities and empowers key operational decisions.**

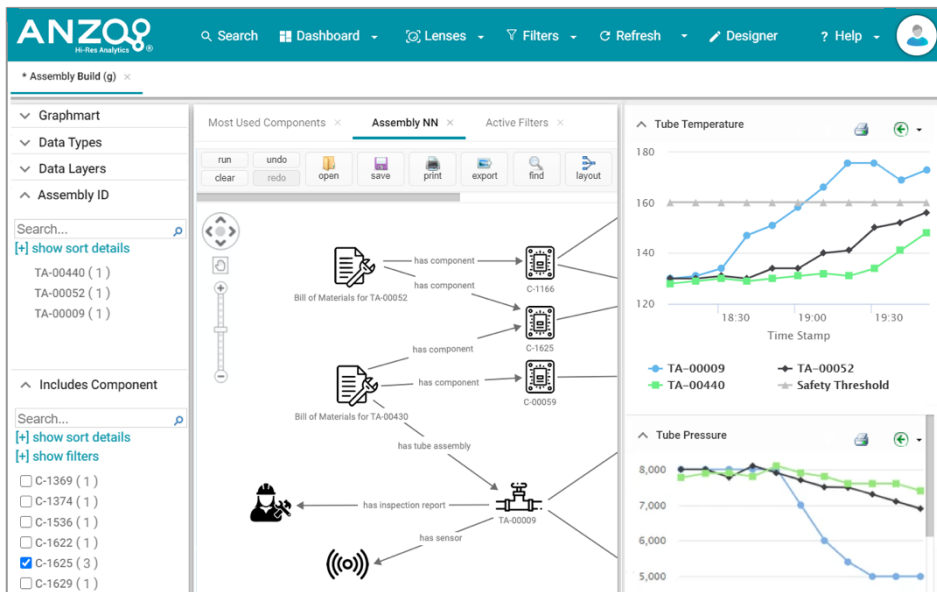

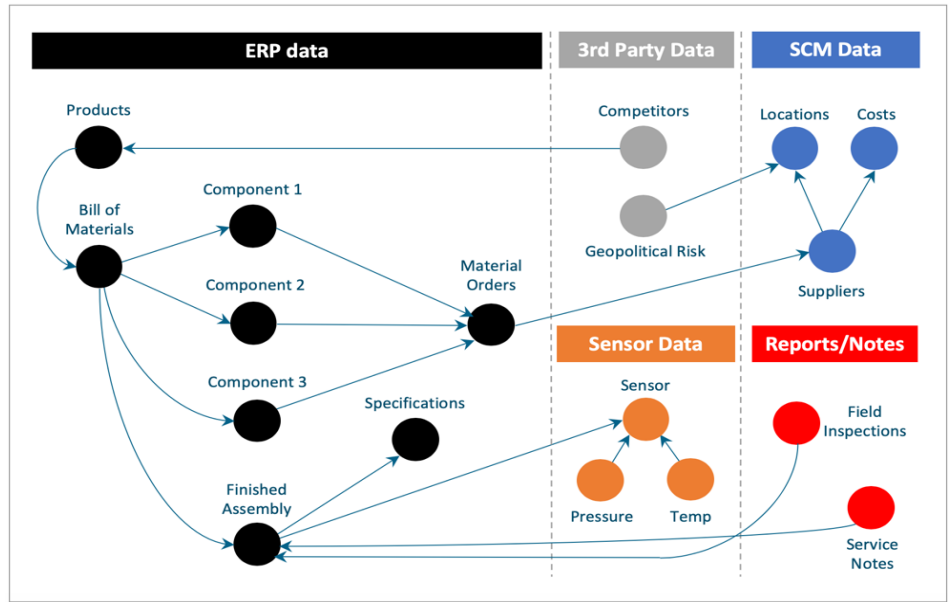

## Anzo: Data discovery and integration spanning your data landscape

Powered by advanced semantic and graph technology, Anzo integrates, transforms and blends vast collections of distributed, disparate systems into blended data assets for analytics on a self-service, on-demand basis - in ways that traditional data warehousing and ETL tools cannot match.

Unlike traditional data models, Anzo uses semantics and the graph data model at break-through speed and scale, built on industry standards to integrate and blend your many varieties of data.

**Anzo catalogs your many disparate data sources in a universal semantic format and integrates data based on common business meaning (see example, right).**

You can integrate new data sources any time, without manual rework often required by relational data models and ETL tools.

**Anzo enables managers and knowledge workers to pick and choose datasets and blend them together for real-time analysis using Anzo's Hi-Res Analytics® (see example, left).**

Users can explore and ask questions across data sets, while Anzo Hi-Res Analytics generates dynamic complex graph queries.

You can also export data for use with other data viz tools and machine learning artificial intelligence (ML/AI) applications.

Anzo is the software platform that provides the data discovery and integration layer critical for Industry 4.0 success, by empowering users to find and understand data drawn from your organization's entire data landscape, on demand.
